Question 1	Objective
Marked out of 3.00	
P Rag question	This is a simple challenge to help you practice printing to stdout.
	We're starting out by printing the most famous computing phrase of all timel in the editor below, use either printf or cout to print the string <i>Hello, World!</i> to stdout.
	Input Format
	You do not need to read any input in this challenge.
	Output Format
	Print Hello, World! to stdout.
	Sample Output
	Hello, World!
	Answer: (penalty regime: 0 %)

Output Format

2 Objective out of This challenge will help you to learn how to take a character, a string and a sentence as input in C. question To take a single character ch as input, you can use scanf("%c", &ch); and printf("%c", ch) writes a character specified by the argument char to stdout char ch: scanf("%c", &ch); printf("%c", ch): This piece of code prints the character ch. Task You have to print the character, ch. Input Format Take a character, ch as input.

```
Answer: (penalty regime: 0 %)
Ace editor not ready. Perhaps reload page?
Falling back to raw text area.
#include<stdio.h>
int main (woid)
    char ch;
     scanf ("%c", &ch);
     printf("%c", ch);
     return 0;
```

Passed all tests! 🗸

Question 3

Y Fag question

Objective

The fundamental data types in c are int, float and char. Today, we're discussing int and float data types.

The printf() function prints the given statement to the console. The syntax is printf("format string",argument_list):. In the function, if we are using an integer, character, string or float as argument, then in the format string we have to write %d (integer), %c (character), %s (string), %f (float) respectively.

The scanf() function reads the input data from the console. The syntax is scanf("format string", argument_list);. For exc.

The scanf("%d", &number) statement reads integer number from the console and stores the given value in variable number.

To input two integers separated by a space on a single line, the command is scanf("%d %d", &n, &m), where n and m are the two integers.

Task

Your task is to take two numbers of int data type, two numbers of float data type as input and output their sum:

- 1. Declare 4 variables: two of type int and two of type float.
- 2. Read 2 lines of input from stdin (according to the sequence given in the 'Input Format' section below) and initialize your 4 variables.
- Use the + and operator to perform the following operations:
- o Print the sum and difference of two int variable on a new line.
- Print the sum and difference of two float variable rounded to one decimal place on a new line.

```
Ace editor not ready. Perhaps reload page?
```

```
Falling back to raw text area.
#include<stdio.h>
int main (void)
    int a,b;
    float c,d;
    scanf ("%d %d", &a, &b);
    scanf ("%f %f", sc, sd);
    printf("%d %d\n",a+b,a-b);
    printf("%0.1f %0.1f\n",c+d,c-d);
    return 0;
```

	Input	Expected	Got	
~	10 4 4.0 2.0	14 6 6.0 2.0	14 6 6.0 2.0	~
~	20 8	28 12 12.0 4.0	28 12 12.9 4.9	~

Passed all tests! <

Question 1	Write a program to input a name (as a single character) and marks of three tests as m1, m2, and m3 of a student considering all the three
Correct	marks have been given in integer format.
Marked out of	
7 Fag question	Now, you need to calculate the average of the given marks and print it along with the name as mentioned in the output format section.
	All the test marks are in integers and hence calculate the average in integer as well. That is, you need to print the integer part of the average only and neglect the decimal part.
	Input format:
	Line 1 : Name(Single character)
	Line 2: Marks scored in the 3 tests separated by single space.
	Output format :
	First line of output prints the name of the student.
	Second line of the output prints the average mark.
	Constraints
	Marks for each student lie in the range 0 to 100 (both inclusive)
	Sample Input 1:

Answer: (penalty regime: 0 %)

```
#include<stdio.h>
1
 2
    int main(void)
3
4 - {
5
        char a:
        int m1, m2, m3;
6
        scanf("%c",&a);
7.
        scanf("%d\n %d\n %d\n",8m1,8m2,8m3);
8
9
        if(m1>100 || m2>100 || m3>100)
10
11 -
             printf("value is out of limits");
12
13
14
        3
        else
15
16 .
        {
             printf("%c\n",a);
17
             printf("%d\n",(m1+m2+m3)/3);
18
19
        ì
20
21
22
        return 0:
23
24
25
26
   3
27
```

	Input	Expected	Got	•
~	A	A	A	4
1	3 4 6	4	4

F ad question
```

Some C data types, their format specifiers, and their most common bit widths are as follows:

- Int ("%d"): 32 Bit integer
- Long ("%id"): 64 bit integer
- Char ("%c"): Character type
- Float ("%/"): 32 bit real value
- Double ("%/f"): 64 bit real value

Reading

To read a data type, use the following syntax:

scanf("format specifier", &val)

For example, to read a character followed by a double: char ch:

For the moment, we can ignore the spacing between format specifiers.

double d:

scanf("%c %lf", &ch, &d);

Printing

To print a data type, use the following syntax:

printf("format specifier", val)

For example, to print a character followed by a double:

char ch = 'd':

double d = 234.432:

printf("%c %if", ch. d);

PROFESSIONAL SPECIMENTS FOR STREET, MICHIGAN STREET, S
